Introduction to Cloud Computing

What is Cloud Computing?

Cloud computing is the delivery of computing services (servers, storage, databases, networking, software, analytics, and intelligence) over the internet ("the cloud") to offer faster innovation, flexible resources, and economies of scale.

Simple Analogy: Think of cloud computing like electricity. You don't need to generate your own power; you simply plug into the electrical grid and pay for what you use. Similarly, you don't need to own and maintain your own servers; you can use cloud services and pay for what you consume.

Key Characteristics of Cloud Computing

1. **On-demand self-service**: Users can provision computing capabilities automatically without human interaction
2. **Broad network access**: Services are available over the network through standard mechanisms
3. **Resource pooling**: Provider's computing resources are pooled to serve multiple consumers
4. **Rapid elasticity**: Capabilities can be elastically provisioned and released
5. **Measured service**: Cloud systems automatically control and optimize resource use
